LM317C Three-Terminal Adjustable Regulator

1 Introduction

LM317C is a three terminal positive voltage regulator with maximum 1.5A current output and adjustable output. The voltage regulator is very easy to use, which only needs two external resistors to set the output voltage, and the output voltage can be set in the range of 1.2V to 37V. In addition, the LM317C is also designed to integrate internal current limiting, thermal shutdown and safe working area compensation, which makes it relatively difficult to damage and basically prevent the burning of circuit fuses.

LM317C serves a variety of applications, including local voltage stabilization and card voltage stabilization. It can also be used to make a programmable voltage regulator, or as a precision current regulator by connecting a fixed resistance between the adjustment point and the output.

2 Available Package

PART NUMBER	PACKAGE
LM317C	SOT-223
	TO-220-3L
	TO-252-2L
	TO-263-2L

Note: For more detailed packaging information, see the part *Pin Configuration and Function* and the part *Mechanical Information*.

3 Features

- The output current exceeds 1.5A
- The output is adjustable from 1.2 V to 37 V
- Internal thermal overload protection
- Temperature independent internal short circuit current limit
- Output transistor safe working area compensation
- Commonly used TO-252 package, as well as other forms of three pin package
- Avoid preparing multiple fixed voltages

4 Applications

- Ethernet Switch, Public Server, Private Switch (PBX)
- Base Station
- Desktop Computer
- IP Telephone: Wired and Wireless
- Motor Control
- Refrigerator, Air Conditioner, Washing Machine
- Security Camera, Digital Sign
- Signal or Waveform Generator
- Substation Control, Power Quality Meter

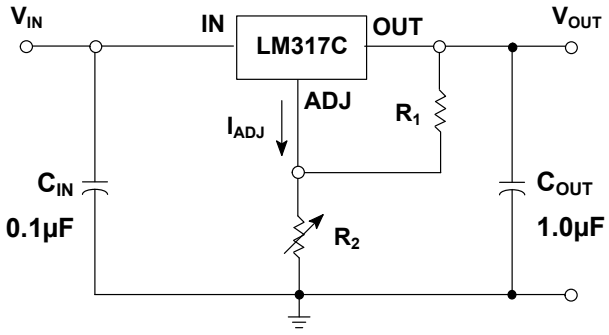

Figure 4-1. Typical Application Circuits

5 Orderable Information

7 Specifications

7.1 Absolute Maximum Ratings(1)

(over operating free-air temperature range, unless otherwise specified)

CHARACTERISTIC			SYMBOL	VALUE	UNITS
Maximum Input-to-output differential voltage			V_{IN} - V_{OUT}	40	V
Programmable output voltage range			V_{OUT}	1.2 ~ 37	
Maximum power dissipation	LM317C	SOT-223	$P_{D\ Max}$	Internally Limited(2)	W
		TO-220-3L			
		TO-252-2L			
		TO-263-2L			
Maximum junction temperature			$T_{J\ Max}$	150	°C
Storage temperature			T_{stg}	-65 ~ 150	°C
Soldering temperature & time			T_{solder}	260°C, 10s	-

(1) Stresses beyond those listed under *Absolute Maximum Ratings* may cause permanent damage to the device. These are stress ratings only, which do not imply functional operation of the device at these or any other conditions beyond those indicated under *Recommended Operating Conditions*. Exposure to absolute-maximum rated conditions for extended periods may affect device reliability.
(2) All voltages are with respect to network ground terminal.
(3) Refer to *Thermal Information* for details.

7.2 Recommended Operating Conditions(4)

PARAMETER	SYMBOL	MIN.	NOM.	MAX.	UNIT
Input-to-output differential voltage	V_{IN} - V_{OUT}	3.0	-	40	V
Programmable output voltage	V_{OUT}	1.2	-	37	V
Output current range	I_{OUT}	0.01	-	1.5	A
Operating junction temperature	T_J	-40	-	125	°C
Operating ambient temperature	T_A	-	-(5)	-	°C

(4) CJ recommends that users should not exceed the rated value in the *Recommended Operating Conditions* for the application conditions of the equipment, so as to ensure the stability of normal operation and reliability of long-term operation of the equipment. Operation beyond the recommended rated conditions does not mean that the product will fail. The consumers need to evaluate the risks that may be caused by the operation of the product beyond the recommended rated conditions.
(5) It is necessary to ensure that the operating junction temperature of the equipment does not exceed the rated value of the recommended operating conditions when using the device for design.

7 Specifications

7.3 ESD Ratings

ESD RATINGS		SYMBOL	VALUE	UNIT
Electrostatic discharge(6)	Human body model	$V_{ESD-HBM}$	2000	V
	Machine model	V_{ESD-MM}	200	

(6) ESD testing is conducted in accordance with the relevant specifications formulated by the Joint Electronic Equipment Engineering Commission (JEDEC). The human body mode (HBM) electrostatic discharge test is based on the JESD22-114D test standard, using a 100pF capacitor and discharging to each pin of the device through a resistance of 1.5kΩ. The electrostatic discharge test in mechanical mode (MM) is based on the JESD22-115-A test standard and uses a 200pF capacitor to discharge directly to each pin of the device.

7.4 Thermal Information

THERMAL METRIC(7)	SYMBOL	LM317C				UNIT
		SOT-223	TO-220-3L	TO-252-2L	TO-263-2L	
Junction-to-ambient thermal resistance	$R_{\Theta JA}$	100.0	66.7	80.0	62.5	°C/W
Maximum power dissipation for continuous operation	$P_{D\ Ref}$	1.00	1.50	1.25	1.60	W

(7) T_A = 25°C, the thermal resistance test of TO-220-3L packages did not add additional radiators, see the part *Notes* for more information about thermal metrics.

7 Specifications

7.5 Electrical Characteristics

			C_{ADJ}[12] = 10μF		60	64	-	

7 Specifications

7.5 Electrical Characteristics (continued)

Note:

(8) Pulse testing techniques are used to maintain the junction temperature as close to the ambient temperature as possible.

(9) Typical numbers represent the most likely norm.

(10) The line regulation is calculated by the following formula:

$$LNR = \frac{\Delta V_{OUT}}{V_{OUT} \times \Delta V_{IN}}$$

where, ΔV_{OUT} is the variation of the output voltage, ΔV_{IN} is the variation of the input voltage.

(11) It is not recommended to output current exceeding 0.15A under the condition of 40V voltage difference between input and output of the device. Under this condition, the output current of more than 0.15A will cause serious internal heating of the device, which will affect the stability of long-term operation of the device, and even cause damage to the device.

(12) C_{ADJ} is connected between the ADJ terminal and GND.

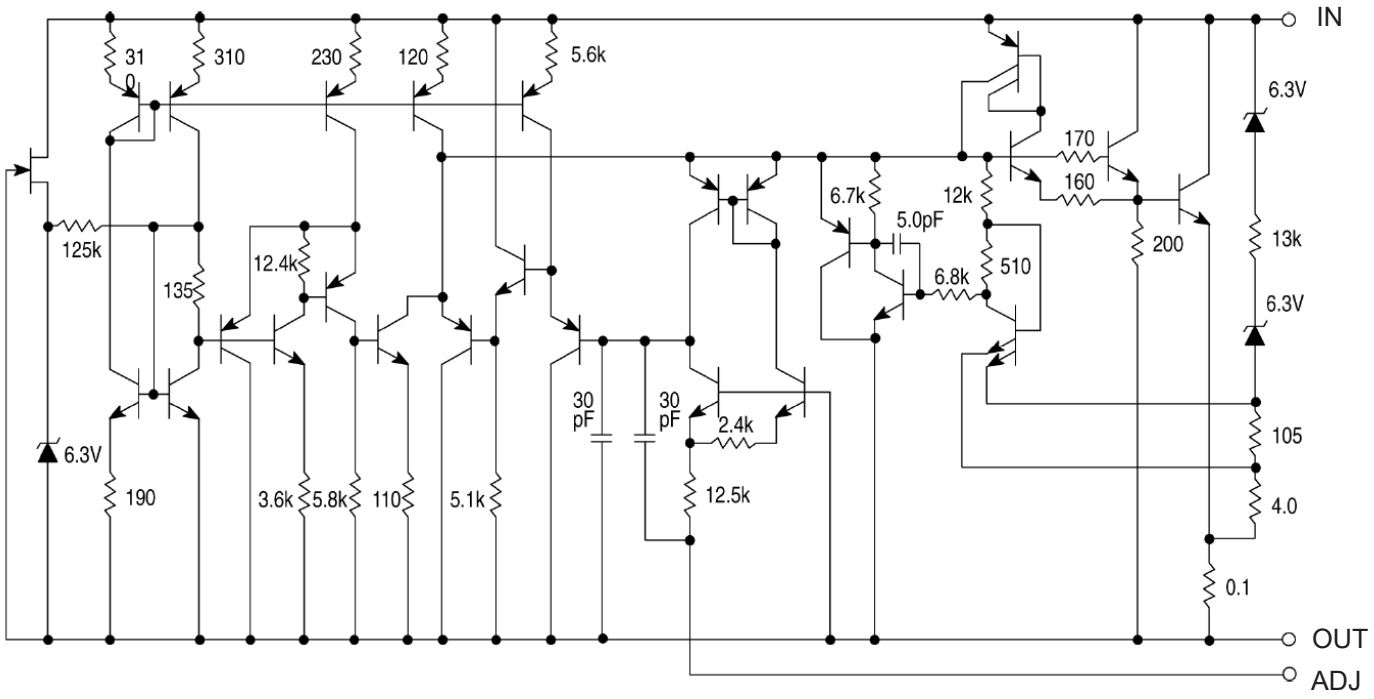
8 Detailed Description

8.1 Description

LM317C is a three terminal positive voltage regulator with adjustable output. By setting two peripheral resistors, the output voltage range of the device can be set from 1.2V to 37V, and the current up to 1.5A can be provided. LM317C integrates current limiting, thermal overload protection and safe operation area protection internally, and corresponding capacitors can be added to improve transient response. Therefore, the device is very easy to use, which is difficult to achieve with a standard three terminal regulator.

8.2 Representative Schematic Diagram



LM317C contains 29 transistors.

8.3 Feature Description

Comprehensive Overload Protection

LM317C is internally integrated with current limit and thermal shutdown protection. When the output current is large or the junction temperature is higher than the rated range of the data sheet to a certain extent, LM317C will enter the protection state and reduce the output to close to 0V to prevent accidental damage to the device. After the output current or junction temperature decreases to a certain extent, LM317C will be released from the protection state and output normally.

When OUT is short circuited to GND, LM317C will also enter the protection state and maintain the current at a low level. If the short circuit is removed, LM317C will also remove the protection status and output normally.

When the input voltage is more than 45V, the device may be damaged due to serious internal heating when the load current is more than 0.4A.

8 Detailed Description

8.3 Feature Description (continued)

Minimum Operating Current

LM317C needs to provide bias current between OUT and ADJ to make the device work normally. The load or feedback must consume this minimum current for regulation, otherwise the output may be too high. Refer to the *Electrical Characteristics* table for the minimum load current required to maintain regulation.

Minimum Operating Voltage Difference

LM317C requires a voltage difference (V_{IN} - V_{OUT}) of at least 3V between input and output before it can operate in the normal working state. The responsible device may not maintain the normal output state.

Programmable Feedback

The device will provide 1.25V (typical value) bias voltage between OUT and ADJ, and the output voltage or current (not both) can be easily programmed through external resistance. For current regulation applications, a single resistor with a resistance value of (1.25V / I_{OUT}) and a rated power greater than ((1.25V)^2 / R) shall be used. For voltage regulation applications, two resistors set the output voltage.

Normal Operation

LM317C is a three terminal positive voltage regulator with adjustable output. During normal operation, LM317C will maintain a reference voltage V_{REF} of 1.25V between OUT and ADJ This reference voltage V_{REF} is converted from R_1 to programming current I_{PROG} (see Figure 8-1), which flows to ground through R_2. The regulated output voltage is given by the following formula:

$$V_{OUT} = V_{REF} \times \left(1 + \frac{R_2}{R_1}\right) + I_{ADJ} \times R_2$$

As an error term in the formula, I_{ADJ} is designed to be less than 100μA and keep constant. Therefore, in most applications, this item can be negligible.

Since the LM317C requires the minimum operating current and the minimum operating voltage difference for normal operation, the corresponding conditions shall be met in the circuit design.

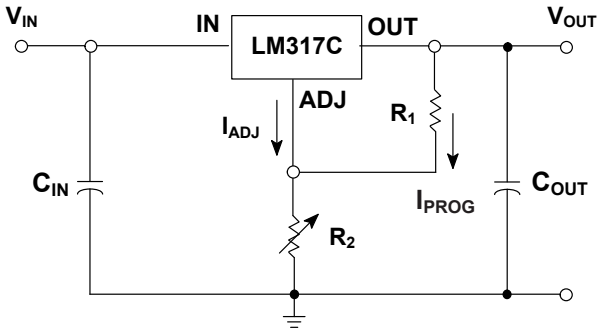


Figure 8-1. Basic Normal Operation

9 Application and Implementation

9.1 Application Information

Load Regulation

Following the following design recommendations can help LM317C achieve better load regulation. The switching resistor R_1 shall be connected as close to the voltage regulator as possible to minimize the voltage drop of the line effectively connected in series with the reference voltage and avoid poor adjustment rate. The grounding terminal of R_2 can be returned close to the load grounding terminal to provide remote grounding sampling and improve the load adjustment rate.

External Capacitors

A 0.1μF disc or 1.0μF tantalum input bypass capacitor (C_{IN}) is recommended to reduce the sensitivity to input line impedance. The adjustment terminal may be bypassed to ground to improve ripple rejection.

A C_{ADJ} of 10μF (between OUT and GND) is recommended to improve ripple rejection. It prevents amplification of the ripple as the output voltage is adjusted higher.

Although the LM317C is stable with no output capacitance, like any feedback circuit, certain values of external capacitance can cause excessive ringing. An output capacitance (C_{OUT}) in the form of a 1.0μF tantalum or 25μF aluminum electrolytic capacitor on the output swamps this effect and insures stability. The input capacitance (C_{IN}) and output capacitance (C_{OUT}) should be placed as close to the corresponding device pins as possible (C_{IN} for IN, C_{OUT} for OUT).

When the LM317C is used as a reference voltage source instead of a peripheral resistor, it is recommended to use an input capacitor of 1.0μF or more to obtain better voltage stability.

Protection Diodes

When external capacitors are used with any IC regulator it is sometimes necessary to add protection diodes to prevent the capacitors from discharging through low current points into the regulator. Figure 9-1 shows the LM317C with the recommended protection diodes for output voltages in excess of 25V or high capacitance values (C_{OUT} > 25μF, C_{ADJ} > 10μF). Diode D_1 prevents C_{OUT} from discharging through the IC during an input short circuit. Diode D_2 protects against capacitor C_{ADJ} discharging through the IC during an output short circuit. The combination of diodes D_1 and D_2 prevents C_{ADJ} from discharging through the IC during an input short circuit.

11 Packaging Information

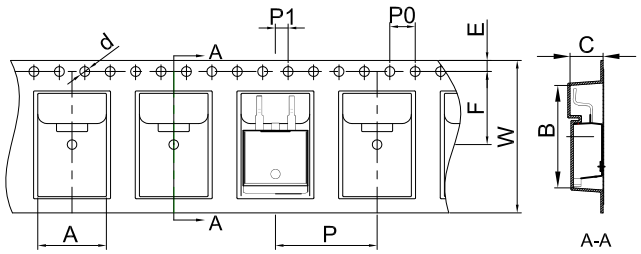
11.3 TO-263-2L Tape and Reel Information

TO-263-2L Embossed Carrier Tape



Packaging Description:

TO-263-2L parts are shipped in tape. The carrier tape is made from a dissipative (carbon filled) polycarbonate resin. The cover tape is a multilayer film (Heat Activated Adhesive in nature) primarily composed of polyester film, adhesive layer, sealant, and anti-static sprayed agent. These reeled parts in standard option are shipped with 800 units per 13" or 33.0 cm diameter reel. The reels are clear in color and is made of polystyrene plastic (anti-static coated).

Dimensions are in millimeter										
Pkg type	A	B	C	d	E	F	P0	P	P1	W

12.2 Notes

Electrostatic Discharge Caution

This IC may be damaged by ESD. Relevant personnel shall comply with correct installation and use specifications to avoid ESD damage to the IC. If appropriate measures are not taken to prevent ESD damage, the hazards caused by ESD include but are not limited to degradation of integrated circuit performance or complete damage of integrated circuit. For some precision integrated circuits, a very small parameter change may cause the whole device to be inconsistent with its published specifications.

Junction-to-ambient Thermal Resistance $R_{\Theta JA}$

Definition: The junction to ambient thermal resistance $R_{\Theta JA}$ is a metric of the thermal performance of the device's packages. By comparing the metric of different companies on the same product package, the thermal performance of the product can be roughly estimated in a relative sense. $R_{\Theta JA}$ is measured under the conditions specified in the corresponding specifications. If the measurement of $R_{\Theta JA}$ of two products follows different specifications and standards, or although the same specifications and standards are adopted, it is not tested in strict accordance with the specifications, then the $R_{\Theta JA}$ of two products will lose the meaning of comparison. This product follows the test specified by JEDEC in the EIA/JESD51-x series documents. $R_{\Theta JA}$ is measured in still air with T_A = 25°C and installed on a 1 in 2 FR-4 board covered with 2 ounces of copper.

Usage: Junction to ambient thermal resistance $R_{\Theta JA}$ is a parameter defined at the system level rather than on a single device or chip. In the test of $R_{\Theta JA}$ provided in the data sheet, most of the heat generated by the operation of the device is dissipated through the test board rather than the packaging surface of the device. In fact, the design and layout of PCB (such as chip or pad size, internal package geometry, etc.) will significantly affect $R_{\Theta JA}$. At this time, any calculation of the junction temperature or thermal power consumption of the device by applying $R_{\Theta JA}$ in the data sheet will have a very large error, so that it does not match the real performance of the device.

Therefore, $R_{\Theta JA}$ should be used as the relative comparison of product packaging thermal performance between different companies, rather than directly using $R_{\Theta JA}$ in the data sheet in the actual calculation.

Reference Maximum Power Dissipation for Continuous Operation $P_{D\ Ref}$

The reference maximum power dissipation for continuous operation $P_{D\ Ref}$ is not an accurate value obtained from the actual test. It is a theoretical value obtained according to the heat dissipation capacity of packaging combined with practical application. It is used to compare the differences of heat dissipation capacity more intuitively between products of different companies. This value is only for estimation reference and cannot be used as an index of the actual performance of the device for circuit design.

12 Notes and Revision History

12.3 Revision History

August 2022: changed from rev-1.0 to rev-1.1:

Modified data sheet format:

All data sheet, added headers, changed font size;

Page 1, modified footer;

Page 1, Introduction, Features, ouput voltage range changed from 1.25V to 1.2V;

Page 2, Orderable Information, changed Max OP T_J: 125°C to OP T_J: -40 to 125°C;

Page 4, Recommended Operating Conditions, changed OP T_J from 0 to 125°C to -40 to 125°C;

Page 4, Absolute Maximum Ratings, Recommended Operating Conditions, changed OP T_J from 0 to 125°C to -40 to 125 °C;

Page 24, DISCLAIMER, deleted the description of "automotive electronics".

June 2022: updated LM317C rev - 1.0.

DISCLAIMER

IMPORTANT NOTICE, PLEASE READ CAREFULLY

The information in this data sheet is intended to describe the operation and characteristics of our products. JSCJ has the right to make any modification, enhancement, improvement, correction or other changes to any content in this data sheet, including but not limited to specification parameters, circuit design and application information, without prior notice.

Any person who purchases or uses JSCJ products for design shall: 1. Select products suitable for circuit application and design; 2. Design, verify and test the rationality of circuit design; 3. Procedures to ensure that the design complies with relevant laws and regulations and the requirements of such laws and regulations. JSCJ makes no warranty or representation as to the accuracy or completeness of the information contained in this data sheet and assumes no responsibility for the application or use of any of the products described in this data sheet.

Without the written consent of JSCJ, this product shall not be used in occasions requiring high quality or high reliability, including but not limited to the following occasions: medical equipment, military facilities and aerospace. JSCJ shall not be responsible for casualties or property losses caused by abnormal use or application of this product.
